“I estimate that the number of ballots that were either requested by someone other than the registered Republican or requested and returned but not counted range from 89,397 to 98,801,” Miller said in the sworn statement ([pdf](#)), according [to Just The News](#).

Elaborating, Miller said that “almost surely, the number of ballots requested by someone other than the registered Republican is between 37,001 and 58,914,” and that “almost surely the number of ballots requested by registered Republicans and returned but not counted is in the range from 38,910 to 56,483.”

Pennsylvania’s state data for early and absentee ballot requests showed 165,412 ballots requested in the names of registered GOP voters that were not counted as of Nov. 16, Miller stated.

Data shows Democratic nominee Joe Biden is ahead of President Donald Trump by around 80,000 votes in Pennsylvania.

Federal Election Commission Chairman Trey Trainor, an appointee of Trump, told the news outlet that Miller’s affidavit is evidence of potential voter fraud.

“This data, which is provided by an expert witness, who would be qualified in almost any court in the country, adds to the conclusions that some level of voter fraud took place in this year’s election,” Trainor remarked. “Therefore, the rush to certify results that are this suspicious from places with known election violations would nullify millions of votes that were legally cast by individual voters.”

Miller, who was educated at Yale and Princeton, said he analyzed data from Pennsylvania’s election that was collected by Matt Braynard, who formerly worked for the Trump campaign, and conducted 2,684 voter interviews by a phone bank.

Pennsylvania Secretary of State Kathy Boockvar’s office said it has found no evidence of voter fraud or mass irregularities. Unfortunately for her, the science, data and eyewitness accounts to fraud don’t seem to match that statement.
